

OLIN

Study of the qualities of and treatments for materials in improved embankments and graded surfaces, to enable the construction of sustainable linear projects.

OLIN's two **main objectives** are:

- To expand the range of soil types placed in embankments, thus reducing the quantity of waste produced in the construction of linear projects.
- To form E-3 embankments using soil treated with lime only.

New technologies in marginal soils, stabilisation with lime and soil type classification using a smart computer tool.
